ABSTRACT

The Resume Search and Candidate Screening System is a Java-based application designed to simplify and automate the recruitment process. The system allows recruiters to upload and manage candidate resumes while automatically extracting important information such as skills, education, work experience, certifications, and contact details. Using keyword-based search and filtering, recruiters can quickly identify candidates who best match the job requirements, reducing the time and effort involved in manual resume screening. The application provides an organized database of resumes, enabling efficient storage, retrieval, and comparison of candidate profiles. It also supports ranking resumes based on their relevance to a given job description, helping recruiters make faster and more accurate hiring decisions. By improving the efficiency of resume management and candidate selection, the system minimizes human effort, reduces screening time, and enhances the overall recruitment process for organizations.
